

Breast cancer – 192 markers

| Tissues and blood | In vitro cultures | Human | Other species |
|-------------------|-------------------|-------|---------------|
|-------------------|-------------------|-------|---------------|

Breast cancer is the most common malignant tumor in women. It is estimated that a genetic basis underlies up to 30% of cases. Genetic alterations promoting breast cancer involve not only mutations of suppressor genes such as BRCA1/2, but also those responsible for tissue density and hormone levels.
